1. Overview and Purpose

The Eastern Green Link 4 (EGL 4) project is being developed as a joint venture by National Grid Electricity Transmission (NGET) and Scottish Power Energy Networks (SPEN) (the Applicants). The project comprises a 2-gigawatt (GW) high voltage direct current (HVDC) system linking Westfield, Fife in Scotland and Lincolnshire in England. The project will include the construction of new infrastructure consisting of underground terrestrial and submarine HVDC cables, onshore converter stations, high voltage alternating current (HVAC) overhead lines or underground cables, as well as potentially new substations or substation extension/upgrade works.

The British Energy Security Strategy set out the United Kingdom (UK) Government's ambition to connect up to 50 GW of offshore generation to the electricity network by 2030. To achieve this target, it will require additional network capacity and greater power transfer capability across the Anglo-Scottish border. EGL 4 is part of this major reinforcement plan of the electricity transmission system that will allow renewable power to reach consumers. It has been identified in the initial list of Accelerated Strategic Transmission Investment projects by Ofgem, the UK energy regulator. The National Policy Statements (NPSs) published in January 2024 identifies projects involving low carbon infrastructure (such as EGL 3) as National Critical Priority Infrastructure.

The marine elements of EGL 4 will not require a statutory Environmental Impact Assessment (EIA) under the EIA Regulations in England and Scotland. However, NGET and SPEN as a matter of best practice, and in line with their obligations under the Schedule of the Electricity Act 1989, and the English and Scotlish Habitats Regulations and UK Offshore Habitats Regulations, have committed to undertake environmental assessments to the same standard. As such the Applicants should be able to demonstrate that all reasonable feasible alternatives have been assessed and that the least damaging option has been selected.

The Applicants undertook a Marine Route Options Appraisal to identify the emerging preferred marine cable route and landfall site. This document is a non-technical summary of the Marine Route Options Appraisal. It details the approach taken by the Applicants, the environmental, socio-economic and agreed technical constraints considered, and the work undertaken (including consultation with stakeholders) to evaluate and appraise the individual options, that concluded with the identification of an emerging preference.

The emerging preference for EGL 4 may be subject to modification following further consultation with stakeholders, technical/engineering feasibility studies, marine survey results and public consultation.

This document should be read in conjunction with the Corridor and Preliminary Routeing and Siting study (CPRSS) for England and the Route Consultation Document for Scotland, the three documents collectively will inform the preferred end-to-end solution for the Project.

2. Options Appraisal Approach

An options appraisal is used to consider the implications of the selection of certain options when developing infrastructure projects. NGET and SPEN have developed a set of over-arching guiding principles for option appraisals. These principles assist in the decision-making process by helping achieve an appropriate balance between the different competing interests that need to be looked at during an options appraisal. There is no hierarchy in the principles, and they are as follows:

- Using or adapting existing infrastructure will generally be given priority over creating new infrastructure.
- Shorter routes will generally be given priority over longer ones, as smaller-scale infrastructure projects are likely to have lower environmental, safety, sustainability and cost implications (for comparable technology options).
- Financially less-expensive options, both in terms of capital and lifetime cost, will generally be given priority, as these support National Grid's statutory duty to develop and maintain an 'efficient, coordinated and economical' network.
- Options which avoid or minimise and mitigate impacts on environmental or socio-economic constraints will generally be given priority over those which have likely significant residual effects, as less environmentally and/or socially damaging routes support National Grid's statutory duty to 'have regard to the desirability of preserving amenity' and will more readily achieve consent.

Four topic areas were considered during the option appraisal process: environment, socio-economic, technical and cost. Within these topic areas there are a list of sub-topics which align with best practice informed by the requirements of the EIA Regulations. Table 2-1 shows the sub-topics used in the marine options appraisal.

¹ The Marine Works (Environmental Impact Assessment) Regulations 2007 (as amended)

² The Electricity Works (Environmental Impact Assessment) (Scotland) Regulations 2017

³ Conservation of Habitats and Species Regulations 2017 (as amended) (England) and Conservation (Natural Habitats, &c.) Regulations 1994 (as amended) (Scotland) and the Conservation of Offshore Marine Habitats and Species Regulations 2017 (as amended)

Table 2-1: Topics used during the marine options appraisal.

Sub-topic	Constraints
Biological Environment	 Highly Protected Marine Areas (HPMAs) European Sites: Special Area of Conservation (SACs), Special Protection Areas (SPAs), Ramsar Sites Marine Protected Areas (MPA): Marine Conservation Zones (MCZ), Nature Conservation Marine Protected Area (NCMPA) Sites of Special Scientific Interest (SSSI) Geological Conservation Review (GCR) sites National Nature Reserves (NNRs)/Marine Nature Reserves (MNRs) National Parks Areas of Outstanding Natural Beauty (AONBs)/National Scenic Areas (NSAs) World Heritage Sites (WHS) UNESCO Biosphere Reserves Heritage Coasts Local Landscape Areas (LLAs) Scotland Local Landscape Designations (LLD) England (various names) Important Bird Areas (IBAs) Annex I Habitat Priority Marine Features (PMF)/Species of Conservation Interest (SOCI)/Priority Coastal Habitats Sensitive Fish Habitat
Historic Environment	Protected WrecksCharted Wrecks
Physical Environment	 Sub Cropping or Outcropping Bedrock Superficial Sediments Mobile Sediments e.g., sandbanks, sand waves Bathymetric Features e.g., large intertidal expanse, bathymetric deeps, steep slopes
Socio-Economic Environment	 Infrastructure (existing, consented or planned) e.g., offshore wind farms, pipelines, cables, oil and gas structures. Shipping and Navigation e.g., shipping lanes/density, traffic separation schemes, restricted navigation channels, anchorages, port limits, navigation lines, pilotage stations Restricted Areas e.g., military practice and exercise areas, marine aggregate areas, carbon capture and storage areas, geological disposal facilities. Commercial Fisheries e.g., bottom drift netting areas, static gear areas, shellfish waters Recreational activities, tourism and bathing waters Marine Planning Major Projects

The appraisal process was completed in three stages as shown Figure 2.1 below.

Data collection

Desktop exercise to collate relevant data on each sub-topic. This included compiling spatially referenced data layers in a geographical information system, information on constraints from publicly available data sources, literature review, and publicly available survey data from other major projects in the study area.

Appraise each option

Each marine route alignment option was examined to determine the constraints it interacted with. For each constraint, consideration was given to the nature, its value or sensitivity and how it could be affected by the marine route alignment option. Each constraint was assigned a risk category based on the risk it posed to development from both a technical and consenting perspective. The combination of rankings for each sub-topic formed an overall evaluation of the marine route alignment option. Stakeholder consultation was undertaken to inform ranking of constraints.

Review and challenge

Discussions were held by the project team to review the findings, challenge judgements, check understandings and assumptions and develop a relative view of the overall performance of each marine route alignment option.

Figure 2-1: Appraisal process

The risk that each sub-topic presented to the viability of the development from either a technical or consenting perspective was assessed by the project team. The categories used were:

Showstopper Very High Risk Medium – High Risk Medium Risk Low Risk Very Low Risk

Several feasible England to Scotland marine route alignments were developed. As many routes shared areas of commonality, these routes were segmented into marine route alignments, with the appraisal carried out on each marine route alignment. This allowed marine route alignments to be grouped together (e.g., English Landfall alignment, Offshore Route alignment, Scotland Offshore Approach and Scottish Landfall alignment) to assess multiple Scotland to England end-to-end marine cable route options.

An iterative, phased process was used to assess these marine route alignments which consisted of workshops (including input from technical and environmental disciplines from both the marine and terrestrial teams), key marine statutory stakeholders and industries consultation followed by either a second set of workshops or refinement of marine route alignments with further targeted stakeholder engagement and follow-up decision-making workshop. This phased process resulted in the development and appraisal of two phases of marine route alignments before the emerging preferred marine cable route option was selected.

3. Landfall and Route Corridor Identification Process

The first stage of the project development process was to identify where the cables could connect into the transmission networks in Scotland and England. The transmission operators identified Westfield, Fife in Scotland and South Humber in England as being the best connection points for this project. Therefore, the marine and terrestrial technical experts focussed on these areas to find potential landfall sites.

In England, a preliminary search area from the Humber to the Wash was identified, with the aim for the cable to connect to the transmission network at Walpole. This search identified three potential landfall sites namely, Horseshoe Point, Theddlethorpe Beach and Anderby Creek. Marine route alignments were developed to the three potential landfall sites for appraisal.

In Scotland, a preliminary search area from Aberdour/Silver Sands to West of Lower Largo/Largo Bay was identified with the aim for the cable to connect to the transmission network at Westfield. This initial search identified six potential landfall sites, which were assessed based on the constructability at the landfall site looking at potential technical and environmental constraints. The initial appraisal excluded one site, resulting in a short list of five landfall sites namely, Kirkcaldy, East Wemyss, Buckhaven, Lower Largo and Largo Bay. Marine route alignments were developed to these five landfall sites for appraisal.

Marine route alignments were designed to each of the potential landfalls in England and Scotland that were technically suitable and avoided key constraints where possible. The primary principle of the exercise was to design a cable route that is technically feasible between the two connection points to deliver the objective of the project. However, within this parameter the aim was to create the shortest marine cable route possible which will minimise the length of cable needed, reduce the manufacturing and installation costs, and minimise the environmental footprint of the project. They were also designed with the following principles in mind:

Avoid environmentally sensitive areas, where possible.

Eastern Green Link 4 (EGL 4) Marine Route Options Appraisal: Non-Technical Summary

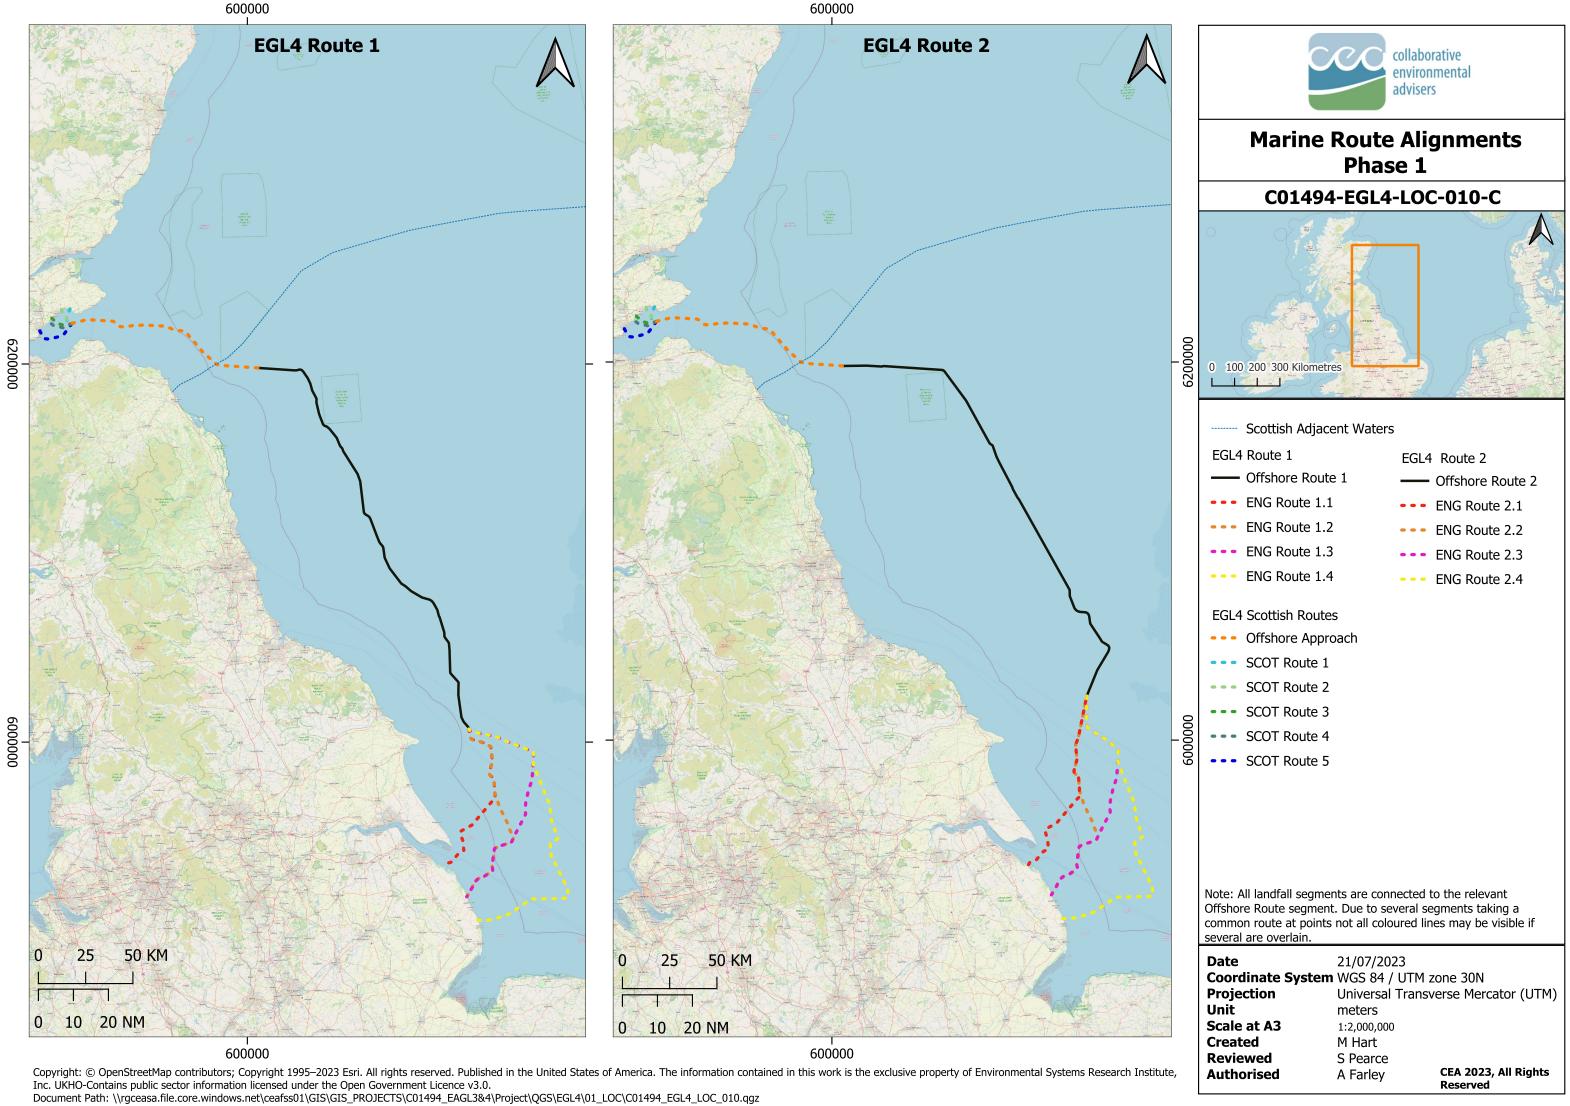

Document reference: C01494b_NGET_REP_D0227

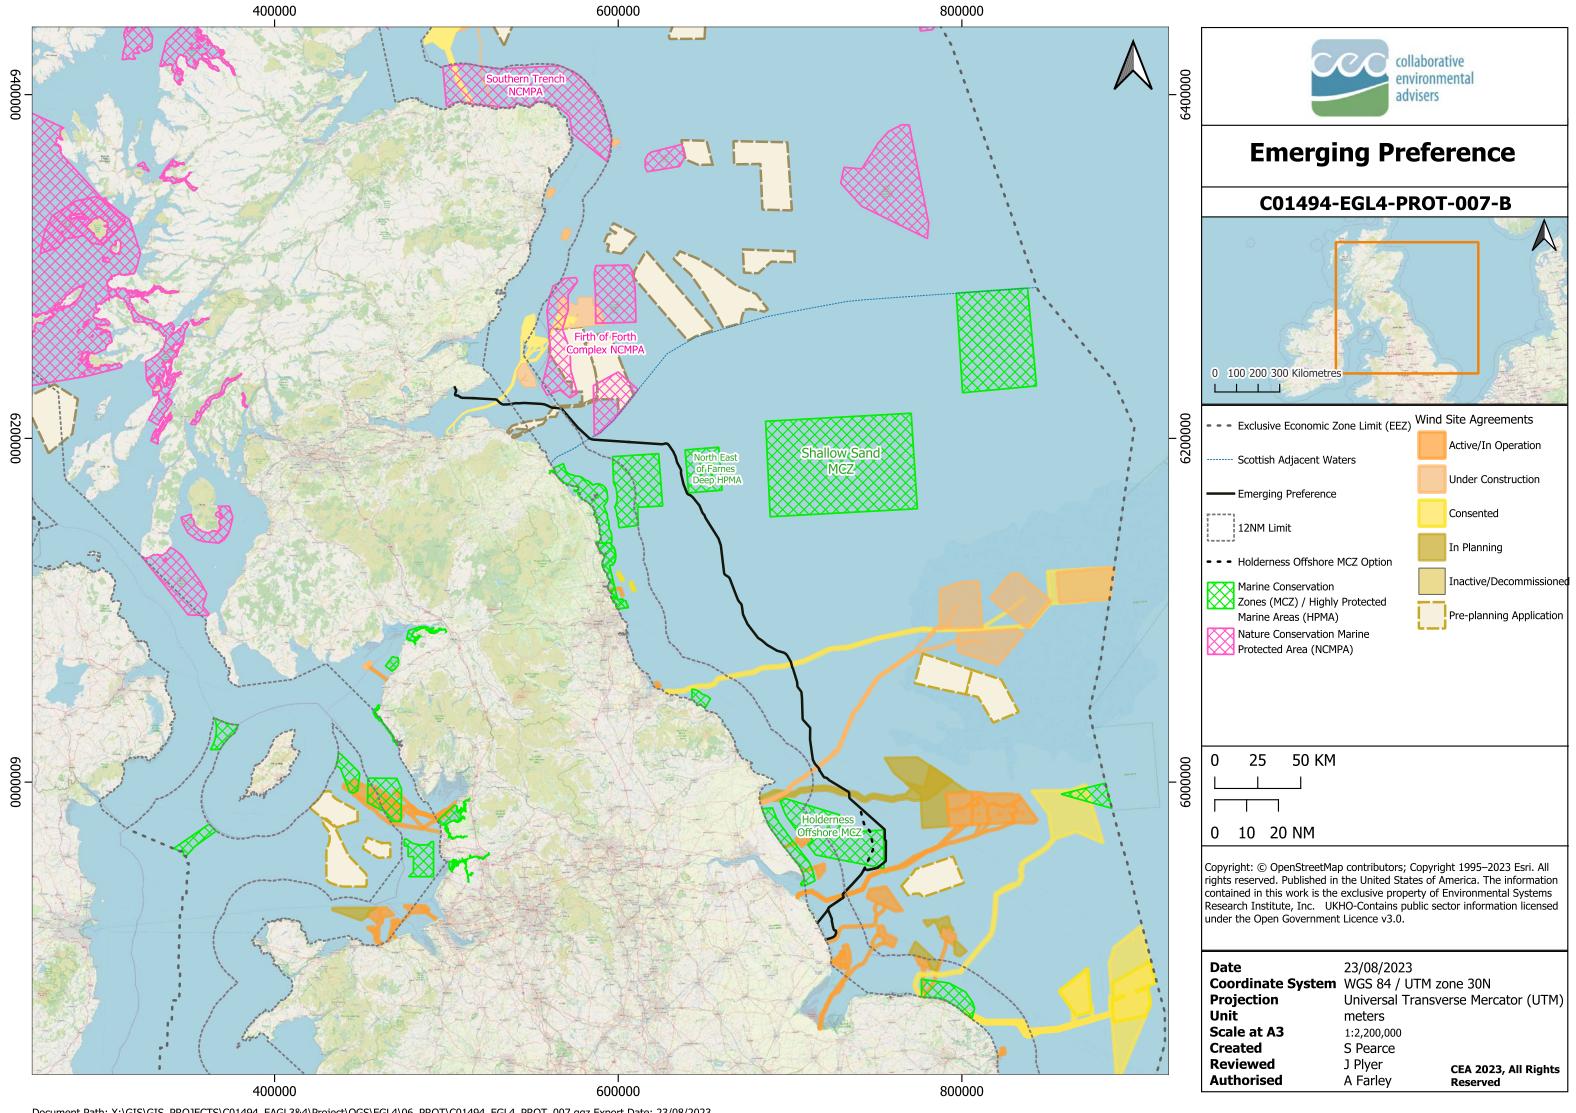

- Avoid areas which would represent restrictions to vessel movement e.g., anchorages, restricted navigation channels where possible.
- Avoid areas of archaeological importance and wrecks where possible.
- Avoid existing offshore infrastructure where possible.
- Avoid and then minimise the crossing of in-service cables and pipelines. Where it is not possible to avoid a crossing altogether, then to seek to optimise the crossing angle and to ensure that navigational safety or water depth is not adversely affected.
- Avoid hazardous seabed e.g., mobile sediments or bedrock outcrops and sub crops.
- Avoid and then minimise any impact on third party considerations such as seasonal fishing activities or local tourism.

Figure 3-1 illustrates the marine route alignments developed during Phase 1. Two offshore marine segments were identified, Offshore Route 1 and Offshore Route 2. These offshore marine route alignments were then linked to the English and Scottish landfall by various options which were developed to avoid key constraints in different manners. Four marine route alignments were identified from the English landfalls to link to Offshore Route 1 and four to link to Offshore Route 2. A common Offshore Approach was developed from Offshore Route 1 and Offshore Route 2 through the Firth of Forth before five marine route alignments were developed to link to the Scottish landfalls.

In England, the review and challenge stage of the options appraisal for Phase 1 routes, led to the removal of Horseshoe Point from the appraisal process and the development of further marine route alignments from Offshore Route 1 to address stakeholder feedback. In Scotland the marine route alignments were also refined with the removal of East Wemyss landfall, and marine route alignments to four landfalls were appraised in Phase 2. Phase 2 marine route alignments are illustrated in Figure 3-2.

4. Environmental and Socio-Economic Constraints

The Scottish and English landfall areas and marine route alignments are heavily constrained by both environmental and socio-economic aspects. Table 4-1 summarises these constraints for the different jurisdictions or jointly where relevant.

Table 4-1: Environmental and socio-economic constraints

Topic	Subtopic/constraint	Summary of constraints within English Waters	Summary of constraints within Scottish Waters			
Biological Environment	Designated sites with marine components	Marine route alignments interact with: 4 SAC, 2 SPA, 1 MCZ, 2 SSSI These sites protect harbour porpoise, wintering birds and broadscale habitats, The marine route alignments avoided a further 20 designated sites.	Marine route alignments interact with: 2 SPA, 1 Ramsar, 1 SSI These sites protect species such as grey seal, wintering birds, ocean quahog and broadscale habitats. The marine route alignments avoided a further 23 designated sites.			
	Designated sites - terrestrial	Marine route alignments interact with: 2 NNR	Marine route alignments interact with: 2 LLA, 3 GCR sites, Kinghorn Rocks (EC-001) seal haul-out, 1 Scottish Wildlife trust area.			
	Annex I Habitats	Marine route alignments interact with: 1110 – Sandbanks which are slightly cove 1170 – Reef i.e., rocky marine habitats or seabed.	•			
	Priority Coastal Habitats	Marine route alignments interact with: Coastal Lagoons – present at Theddlethorpe landfall site Fixed dunes with herbaceous vegetation ('grey dunes') - present at Theddlethorpe landfall site	Marine route alignments interact with: Sand dune vegetation – present at the Lower Largo/Lundin Links landfall site			
	Priority Marine Features/Biodiversity Action Plan Priority Habitats/Sensitive Fish Habitat	Marine route alignments interact with Sandeel habitat and herring spawning and nursery grounds Kinghorn Rocks seal haul out site Areas suitable for seagrass				
Historic Environment	Protected Wrecks Charted Wrecks	No protected wrecks within or in close proximity to marine route alignments. Over 94,000 wrecks or obstructions found around the UK, a 250 m buffer win development of marine alignments to avoid interaction with known/charter.				
Physical Environment	Sub Cropping or Outcropping Bedrock Superficial Sediments Mobile Sediments Bathymetric Features	A data set which shows area of hard substresolution UKHO bathymetry data set to id subcropping/outcropping, mobile sediment avoided by the marine route alignments.	•			
Socio-economic Environment	Infrastructure Offshore Wind Farms	9 operational OWFs 9 OWFs in planning/construction stage	3 operational OWFs 10 OWFs in planning/construction stage			
	Cables	Marine route alignments interact with: 2 operational interconnectors, 6 planned reinterconnectors, 9 operational telecommunicables				
	Oil & Gas	Marine route alignments interact with: 16 active pipelines and 12 not in use or abandoned pipelines				

Topic	Subtopic/constraint	Summary of constraints within English Waters	Summary of constraints within Scottish Waters		
	Shipping and Navigation	The route engineering has designed crossings to avoid any TSSs and high-density shipping areas. Crossing within shipping lanes perpendicular to minimise distance through these areas and to minimise disruption to shipping during the survey and installation campaign. Consideration has been given to the design of cable crossings in shallow water so that they are designed to keep under keel clearance of vessels to a maximum to minimise impact to shipping and navigation especially in those areas of high intensity. Marine route alignments were designed to be a minimum of 50 m away from any navigation buoys and point infrastructure such as harbour facilities including posts/stakes and outfall pipe diffusers. Consultation with Forth Ports has been undertaken and will continue during the project.			
	Restricted areas	No aquaculture sites 15 aggregate extraction sites 11 dredging, spoil and dumping grounds 4 small explosive dumping grounds 41 MoD PEXA, including Donna Nook Firing range, England and Submarine exercise area in the Firth of Forth, Scotland Area of Foul ground in Firth of Forth 20 Anchorages within Firth of Forth			
	Commercial fisheries	A preliminary review of commercial fishing activity was undertaken on the whole of the proposed marine route alignments			
	Marine planning	Consideration given to: North East Offshore Marine Plan East Inshore and Offshore Marine Plan	Consideration given to: Scottish National Marine Plan		
	Major projects in planning	Geological Disposal Facility 2 Carbon Capture and Storage projects Horseshoe Point - pilot project for reinstatement and regeneration of seagrass, native oyster and saltmarsh. South Humber Gateway Strategy	Restoration Forth – Seagrass & Oyster beds		

5. Assessment Summary

5.1. Phase 1

The Phase 1 marine route alignments were split into three groups: English Landfalls, Offshore Approach and Offshore Route and Scottish landfalls. Table 5-1 presents the Phase 1 appraisal of the English landfall marine route alignments.

Eastern Green Link 4 (EGL 4) Marine Route Options Appraisal: Non-Technical Summary

Document reference: C01494b_NGET_REP_D0227

The Phase 1 appraisal of the English landfall marine route alignments concluded:

- ENG Route 1.1, 2.1, 1.2, 2.2, 1.3, 2.3, 1.4 and 2.4, all the marine route alignments were assessed as being a very high risk under the biological environment category as they cross the Southern North Sea SAC, Humber Estuary SAC, SPA, SSSI, Greater Wash SPA, Holderness Offshore MCZ, Saltfleetby Theddlethorpe Dunes to Gibraltar SAC. It should be noted not all of the marine route alignments cross all the designated sites.
- ENG Route 1.1, 2.1, 1.2, 2.2, 1.3, 2.3, 1.4 and 2.4, all the marine route alignments require a minimum of four and maximum of nine crossings within designated sites which would lead to permanent habitat loss.
- ENG Route 1.1 and 2.1 to Horseshoe Point were going to be heavily constrained due to the existing export cables for Hornsea 1 and 2 OWFs. The marine route alignments would also cross the main shipping channel into the Humber Estuary and the ports of Grimsby, Immingham, Hull and Goole and were therefore ruled out.
- ENG Route 1.2, 1.3, 2.2 and 2.3 to Theddlethorpe and ENG Route 1.4 and 2.4 to Anderby Creek shared several constraints. There are several excellent rated bathing water areas on the coastline which are managed by the Environment Agency for the purposes of coastal protection. The coastline here is also being looked at by several other major projects as potential landfall locations. The ENG 1.4 and 2.4 routes were the least preferred due to the marine route alignment crossing the Inner Dowsing, Race Bank and North Ridge SAC, however it was suggested if an alternative marine route alignment could be found to avoid the SAC, Anderby Creek could potentially be the preferred landfall.
- Marine route alignments to Theddlethorpe e.g., ENG Route 1.2, 1.3, 2.2 and 2.3 were identified as preferrable to those marine route alignments to Anderby Creek following the Phase 1 assessment, however all marine route alignments had a significant number of consenting challenges.

As the options appraisal process could not identify a marine route alignment to an English landfall which did not have any Very highrisk constraints the decision was taken to identify new marine route alignments and subsequently a Phase 2 assessment was undertaken.

Table 5-2 presents the appraisal of the Offshore marine route alignments and Offshore Approach.

Table 5-2: Phase 1 appraisal for Offshore marine alignments

	Offshore Approach	Offsho	e Route 1	Offshore R	oute 2
Route length (km)	108	242		256

Key to Risk Categories Shows	topper Very High Risk	Medium – High	Risk Medium Risk	Low Risk	Very Low Risk

The Phase 1 appraisal concludes that Offshore Route 1 would be a lower risk route than Offshore Route 2 as it avoided infrastructure crossings with designated sites and avoided mapped Annex I habitat.

Table 5-3 presents the Phase 1 appraisal of the Scottish landfall marine route alignments.

acong nation of the area and a suppose notice (cr. to, or r., area nation)							
Key to Risk Categories	Showstopper	Very High Risk	Medium – High Risk	Medium Risk	Low Risk	Very Low Risk	

The Phase 1 appraisal of the Scottish landfall marine route alignments concluded:

- SCOT Route 1, 2, 3, 4 and 5 marine route alignments share many common constraints with the principal biological constraints driving the medium-high risk ranking on all marine route alignments being the crossing of the Firth of Forth and St Andrews Bay Complex SPA, and the landfalls all being within the Firth of Forth SPA and Firth of Forth SSSI.
- SCOT Route 4 was assessed a black risk category as the marine route alignment crosses through the centre of an area of 'foul ground'. Following consultation with the MoD it was advised to avoid the area for all intrusive seabed works and the marine route alignment was therefore ruled out. SCOT Route 3 marine route alignment also crosses the northerly edge of the 'foul ground' but was given a very high-risk category. Consultation with Forth Ports was also undertaken to check the feasibility of moving adjacent anchorages further north to allow the marine route alignment to go between the anchorages and the foul ground.
- SCOT Route 5 marine route alignment was ranked third from a marine environmental and technical perspective. However, the marine route alignment is the longest through Firth of Forth and St Andrews Bay Complex SPA, it also passes through an area of high shipping density as identified by Forth Ports and interacts with the designated seal haul out site at Kinghorn.
- SCOT Route 1 and 2 have similar constraints and risks. The marine route alignments are the two shortest routes through the Firth of Forth and St Andrews Bay Complex SPA and cross areas with relative lower species densities for protected diver and sea duck species. In addition, both marine route alignments are within an area of lower shipping density and avoid all Forth Ports anchorages.

Following the Phase 1 appraisal, SCOT Route 1 and 2 emerged as the preferred options, but it was concluded that further discussion with Forth Ports may identify that with further refinements SCOT Route 3 could be developed to avoid foul ground and anchorages.

5.2. Phase 2

In England, following stakeholder feedback, the design objectives for Phase 2 was to identify marine route alignments to Anderby Creek and Theddlethorpe that avoided the Inner Dowsing, Race Bank and North Ridge SAC, Saltfleetby – Theddlethorpe Dunes to Gibraltar Point SAC and the Holderness Offshore MCZ. If a route around the Holderness Offshore MCZ could not be developed, then design sought to avoid the potential for the deposit of external cable protection within the site e.g., by avoiding infrastructure crossings.

Four new marine route alignments were developed to Anderby Creek and one to Theddlethorpe. These marine route alignments merged to a single point from which two nearshore approach marine route alignments were designed around and through Holderness Offshore MCZ to join the emerging preferred marine route alignment Offshore Route 1.

In Scotland, following stakeholder feedback from the MoD and Forth Ports new marine route alignments were developed to four landfalls identified within the original landfall search areas, namely Kinghorn (North and South), Buckhaven, Lower Largo / Lundin Links and Largo Bay in Fife. The marine route alignment Offshore Approach was refined to optimise the nearshore approaches to the landfalls and connect to Offshore Route 1 (emerging preference from Phase 1).

Table 5-4 presents the appraisal of the English landfall marine route alignments. Table 5-5 presents the English nearshore approach marine route alignments, and Table 5-6 presents the appraisal of the Scottish landfall marine route alignments.

The Phase 2 appraisal of marine route alignments concluded:

- ENG Nearshore Approach A was the emerging preference as it avoided any crossings within the Holderness Offshore MCZ rather than several crossings through it like Nearshore Approach B.
- All four of the Anderby Creek marine route alignments would require six third-party infrastructure crossings within the Greater Wash SPA with the associated permanent loss of supporting habitat.
- Anderby Creek 4 was the least preferred of the Phase 2 marine landfall route alignments due the route crossing an area of current and future marine aggregate production. Consultation with the marine aggregate industry concluded that this was not currently feasible. Anderby Creek 3 was also ruled out following information provided by the marine aggregate industry confirming high levels of Sabellaria spinulosa reef along the proposed marine route alignment.
- The remaining three marine route alignments are very similar based on the offshore constraints. Theddlethorpe was the shortest marine route alignment however it does have more challenging onshore constraints associated with the presence of the Saltfleetby Theddlethorpe Dunes & Gibraltar Point SAC. Although it is considered possible a technical solution that mitigates impacts on site integrity may be possible. The remaining Anderby Creek marine route alignments do not have this onshore constraint, although they would need to navigate coastal defences and beach nourishment schemes and all required six third-party crossings with the Greater Wash SPA..
- Whilst marine route alignments Anderby Creek 1 and 2 have similar constraints, Anderby Creek 2 was ranked as the emerging preference.
- The East Wemyss to Buckhaven marine route alignment was ruled out as it was assessed as not technically feasible.
- The Kinghorn marine route alignment was assessed as having a very high consenting risk due to the presence of the designated Kinghorn seal haul-out. The seal haul-out overlaps with the northern Kinghorn landfall site, whilst the southern landfall site is on the boundary of the designated area. The marine route alignment is the longest of those appraised through the Firth of Forth and St Andrews Bay Complex SPA.
- The East of Lower Largo marine route alignment to the Largo Bay landfall and the Leven to Lower Largo marine route alignment to the Lower Largo / Lundin Links landfall are similarly constrained with little to differentiate between the two options. The options appraisal concluded that the Largo Bay landfall and the East of Lower Largo marine route alignment were the emerging preference.

6. Emerging Preference

The marine route options appraisal concluded that the following marine route alignments represent the emerging preferred marine route:

- Landfall at Largo Bay, Scotland
- East of Lower Largo marine route alignment
- Offshore Approach
- Offshore Route 1
- ENG Nearshore Approach A
- Anderby Creek 2
- Landfall at Anderby Creek, England

It should be noted that the emerging preferences may change following the geophysical, geotechnical and environmental survey which are due to be undertaken for the project. Should something unexpected emerge from these surveys the route designs will be revisited.

The emerging preference for EGL 4 is the marine cable route as presented in Figure 6-1, subject to the following conditions:

- Following the geophysical, geotechnical and environmental survey and further engagement with stakeholders the consent challenges around ENG Nearshore Approach B should be re-appraised. If the consent challenges can be de-risked or mitigated ENG Nearshore Approach B could be a feasible alternative.
- At present the Theddlethorpe landfall is the least preferred English landfall due to the proximity to Saltfleetby-Theddlethorpe Dunes and Gibraltar Point SAC, though from a nearshore perspective is advantageous due to not requiring any third-party crossings within the Greater Wash SPA which would be required for Anderby Creek. On balance, due the concerns about potential impacts on integrity of the Saltfleetby-Theddlethorpe Dunes and Gibraltar Point SAC, Anderby Creek is the most preferable from a landfall perspective. However, engineering studies may identify a design solution that mitigates the potential impact in which case Theddlethorpe and Anderby Creek 2 marine route alignments should be reappraised.
- Kinghorn landfall is the least preferred Scottish landfall due to the potential for a harassment offence at the Kinghorn seal haul-out site. Should engineering studies identify a design solution that mitigates the potential impact on the haul-out site, the Kinghorn marine route alignment should be re-appraised. Engagement with Forth Ports will also be necessary to assuage concerns regarding disruption to shipping for this landfall.
